

MANAGING AND MAINTAINING STRONG PASSWORDS

Protecting sensitive information starts with a secure password. Here are a few tips on how to create secure passwords and keep them safe:

Password

Weak

Password

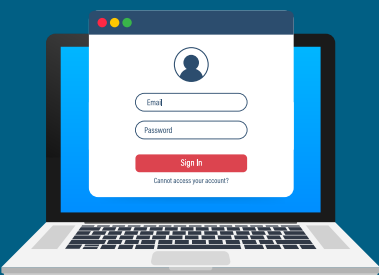

Medium

Password

Strong

Make each password long and strong. The more characters in your password, the stronger it is.

Use multiple words to create a passphrase, such as “Don’t forget to stand” or “stopping-woods-snowy-evening”.

Create a unique password for each account. If you can’t remember them all, ask if you can use a password manager.

Password managers are security programs that securely generate, store, and retrieve passwords for you. This makes it simple to keep a strong and unique password for every account and securely store them in one place.

PxH1#n!8

Password managers can randomly generate exceptionally strong passwords for all your accounts, and you’ll never have to remember or type them.

A password manager will encrypt and securely store all your passwords and can automatically and securely log you into the websites you are visiting.
